

IBM MQ Economic Cost & Efficiency Assessment

Executive Assessment Report & Economic Baseline

CUSTOMER ORGANIZATION	ASSESSMENT SCOPE	ASSESSMENT DATE	ENGINE VERSION
Global Financial Services Corp	IBM MQ Economic Cost & Efficiency Assessment	2026-09-25	v1.0.0

1. Executive Summary

QUANTIFIED OPERATIONAL LABOR \$151,615 1,752 hrs/yr0.84 FTE	SINGLE-EVENT EXPOSURE \$720,000 Representative EventCUSTOMER FACT	CUSTOMER-REPORTED MQ SPEND \$350,000 Isolated Spend (Q21)CUSTOMER FACT	ILLUSTRATIVE ECONOMIC VALUE \$37,904 438 hrs recoveredSCENARIO
--	--	---	---

This report delivers an objective, deterministic baseline of ongoing operational effort, staffing allocations, and potential business disruption exposure for **Global Financial Services Corp**’s IBM MQ messaging infrastructure.

Quantified baseline operational effort totals **1,752 annual staff hours**, representing an annual operational labor burden of **\$151,615** (equivalent to 0.84 FTEs across routine administration and incident troubleshooting).

Under the approved model baseline assumptions (addressing 50% of routine administration with 50% efficiency and reducing investigation effort by 25%), the modeled scenario indicates an **illustrative economic value of approximately \$37,904** annually through the recovery of 438 staff hours.

2. Operational Effort & Labor Cost Decomposition

Workload Category	Calculation Driver	Annual Hours	FTE Equiv.	Labor Cost	Provenance
Routine Administration Quarterly Admin: 48.0 hrs x 4 quarters	Q04 Admin Workload	192.0	0.09	\$16,615	CALCULATED
Incident Troubleshooting 52 incidents/yr x 30.0 staff hrs/investigation	Q06 Frequency x Q07 Staff Effort	1,560.0	0.75	\$135,000	CALCULATED
Total Quantified Operational Labor	Loaded Rate: \$86.54/hr (\$180k/2,080h)	1,752	0.84	\$151,615	CALCULATED

3. Business Exposure & Isolated MQ Spend

REPRESENTATIVE SINGLE-EVENT EXPOSURE CUSTOMER FACT \$720,000 Modeled Consequence: Duration (72.0 hrs) × Customer Hourly Rate (\$10,000/hr from Q15). Interpretation Safeguard: This figure models the consequence of one representative disruption event and must never be interpreted as an annualized loss estimate.	CUSTOMER-REPORTED ANNUAL MQ SPEND CUSTOMER FACT \$350,000 Direct Customer Input: Provided in Discovery Question Q21. Isolation Rule: Customer-Reported Spend is preserved in strict isolation and is never added to operational labor or used to derive ROI metrics.
---	---

4. Improvement Scenarios & Productivity Opportunity

TROUBLESHOOTING PRODUCTIVITY OPPORTUNITY (10%) CALCULATED \$13,500 Direct 10% productivity opportunity applied to annual troubleshooting labor (\$135,000). Kept strictly separate from the 25% scenario.	MESHIQ IMPROVEMENT SCENARIO SCENARIO \$37,904 Recovers 438 hours/yr based on 50% routine admin share × 50% admin efficiency + 25% troubleshooting reduction. Illustrative only.
--	--

5. Data Provenance & Trust Classification

Classification Tier	Definition & Meaning	Metric Examples
CUSTOMER FACT	Direct customer-provided information entered during assessment	Q01 Scale, Q04 Workload, Q06 Frequency, Q07 Hours, Q21 Spend
INDUSTRY BENCHMARK	External standard applied under approved governance fallback rules	ITIC \$300,000/hr (Applied when Q15 unknown & Q12 significant)
CALCULATED METRIC	Deterministic mathematical result derived from customer facts	Routine Admin Cost, Troubleshooting Labor Cost, FTE Burden
MODEL BASELINE	Approved scenario parameter baseline	50% Addressable Admin Share, 50% Efficiency, 25% Investigation
ILLUSTRATIVE SCENARIO	Exploratory modeled outcome based on approved scenario baseline	Illustrative Economic Value (\$37,903.85)

Important Financial Interpretation Safeguards & Disclaimers

• **Representative Single-Event Exposure ≠ Annual Loss:** The exposure figure represents a single modeled disruption event and must never be interpreted as an annualized loss estimate.

• **Illustrative Economic Value ≠ Guaranteed Savings:** Improvement scenario outcomes represent capacity recovery models and do not constitute guaranteed savings or committed ROI.

• **Deterministic Presentation:** All values are rendered directly from the immutable calculation snapshot (ID: snap-gm-01-a4b8) without independent presentation-layer recomputation.
